

Tando provides these instructions as general guidelines only. The contractor and/or installer shall be responsible for ensuring that all applicable local building codes are followed, which may require modification of these general guidelines. Tando assumes no liability for personal injury or property damage resulting from improper or careless application of the described techniques.

For more information on Tando and its wide variety of state of the art products, please call us at 844-MY-TANDO (844.698.2636).

Installation Guidelines can be downloaded from our website: TANDOSHAKE.COM.

HAND SPLIT SHAKE INSTALLATION GUIDE

GENERAL INFORMATION

1-Tando products are intended for use in a vertical placement only and are not designed or warranted for roofing or flooring applications. However mansard roofs with a 45/12 slope or greater are acceptable applications.

2-Tando products are designed as an exterior cladding, not as a weather resistant barrier. TandoShake is designed to allow the material underneath it to breathe; therefore, it is not a watertight covering. To achieve designed performance, TandoShake must be installed over a weather resistant house barrier system, such as house wrap.

3-As with the majority of exterior building materials, Tando products will expand and contract with a change in temperature. Therefore, during installation it is necessary to position the TandoShake properly to compensate for temperature effects.

4-It is essential to work over a smooth, flat, nailable wall surface, (i.e. minimum 7/16"(1.11cm) OSB board or plywood is recommended). If Tando products are being installed over furring strips, furring strips must be installed on a 45° angle, spaced 8"(20.32cm) center to center, while ensuring that the side seams are supported by furring strips.

5-Fixtures cannot be installed directly to TandoShake; always use a wooden support or specifically designed mounting blocks to attach fixtures. Follow the mounting block manufacturer's installation instructions and ensure proper clearance to the TandoShake (recommended minimum of 1/4"(0.64cm)) to allow room for expansion and contraction.

6-Non-corrosive fasteners are required to secure the sections and they must penetrate through the solid surface by at least 1 1/4"(3.18cm) and into a solid substrate by at least 7/16"(1.11cm).

7-Always begin the installation at the lowest point of the structure, work from left to right installing one row at a time, and completing one wall before beginning another.

8-Store product on edge (vertical), do not stack flat.

9-Keep the R-E-L number, located on the box of your products (ex: REL-123456) for future reference.

10-To cut the material, it is recommended to use a circular saw with a thin kerf finishing blade.

11-Some finish trims such as J-channel and Outside Corner Post, must be installed on wall prior to installation of TandoShake. Follow the finish trim manufacturer's instructions for proper installation.

12-Fastening TandoShake should not restrict movement. Fasteners should be driven straight into the center of any nailing slot with the head of the fastener making light contact with the product, allowing the section to be hung. The center nail hole must always be securely fastened to ensure that the section expands and contracts from the center out.

13-If a partial piece is used at either end, a new center hole should be created, by drilling a 1/8"(0.32cm) hole in the top flange, near the center of the section at the same height as the other installation holes.

14-If face nailing is employed, pre-drill a hole in an inconspicuous area, such as a shingle seam. The hole must be larger than the shank of the nail or screw, but smaller than the head, to allow for possible thermal movement. The head can be covered with matching paint or caulk.

15-It is best to work with the product at waist-level, allowing the installer to inspect the back of the product, verifying that all fingers are properly engaged. Do not force product up into the upper fingers of the lower row, as this may damage the stop posts and/or will override the expansion joints and cause buckling.

16-Fitting product between windows and around openings requires a spacing of 1/4"(0.64cm) to allow for expansion.

17-Variations in shade and color are an inherent characteristic of TandoShake natural color.

HAND SPLIT SHAKE INSTALLATION GUIDE

BASIC GUIDELINES

1-Always fasten through the center of the nailing slots. Each complete Hand Split Shake must be fastened through the center hole, at both extremities plus 1 other evenly spaced on each side of the center hole and have a minimum of 6 fasteners, i.e. 5 fasteners in the horizontal nailing channel at maximum spacing of 8"(20.32cm) or less and 1 additional fastener into the lateral hole (Figure 1). If TandoShake is installed on a wall with furrings, furring strips should be installed on a 45° angle, at 8"(20.32cm) center to center and a furring strip is required behind each fastener.

Figure 1

2-Never hammer or screw the fasteners in completely; leave a gap of 1/16"(0.16cm) between the nailing channel and the fastener's head (Figure 2). Always use non-corrosive nails or screws with a head of 0.4"(1cm) in diameter and a body of 0.150"(0.38cm) in diameter and penetrate through the solid surface by at least 1 1/4"(3.18cm) and into a solid substrate by at least 7/16"(1.11cm).

Figure 2

3-Make sure that all pieces are properly joined together (two side locks and 9 hooks at the bottom of the section) (Figure 3).

Figure 3

4-When using a finish trim (J-channel, Outside Corner Post, etc.), leave a space of 1/4"(0.64cm) between the trim and the TandoShake (Figure 4). The required opening for finish trim is 1 1/8"(2.86cm).

HAND SPLIT SHAKE INSTALLATION GUIDE

INSTALLATION STEPS

1-First install the starter strips at the lowest point of the structure. Make sure that the horizontal starting line is perfectly leveled and square with the wall. Leave a 3 1/2" (8.89cm) gap at each end of the wall for corner posts, corners or J-channels (1). If a floor is against the wall, install the top of the starter strips at 2 3/8" (6.03cm) above it in order to leave a gap of 1/2" (1.27cm) between starter strips and the floor (2). If there is no floor, starter strips should be flush with the base of the wall. Fasten the starter strips at maximum spacing of 8" (20.32cm) or less. Install the next starter strip by pressing it against the previous (3) and fasten as mentioned above (Figure A). Be sure to align adjacent walls.

2-Determine the number of sections needed for the wall by dividing the total length of the wall between the corner pieces previously installed (see corners installation instruction section for details), by 39 1/4" (99.70cm). Cut the left side of the first section in a straight line in order to avoid having a very small piece at the right end of the wall. Any installed section should be at least 12" (30.48cm) long (Figure B).

3-Insert the first section into the starter strip and slide it into the corner or finish trim leaving a space of 1/4" (0.64cm) between the inside wall of the corner or trim and the section (Figure C).

4-On each section, fasten the center hole of the product, this will ensure even movement of sections in both directions during expansion/contraction. Also place a fastener into the last hole on both ends, plus another one evenly spaced on each side of the center hole of the nailing channel (Figure D). Fasteners should never be spaced more than 8" (20.32cm). Each full length section should be secured with a minimum of 6 fasteners, i.e. 5 fasteners in the nailing channel and 1 fastener into the lateral hole. Remember that fasteners must be placed in the center of the nailing slots. Always use non-corrosive fasteners penetrating into a solid substrate of no less than 7/16" (1.11cm) thick. When attaching the fasteners, be sure they only lightly touch the product allowing it to move with varying temperatures and they are installed flush with the section, so as not to interfere with the succeeding row.

- If the product is installed on a furring wall, a furring strip is required behind each fastener.
- If a section does not have the initial center hole, drill a new center hole of 1/8" (0.32cm) diameter at the same height as the other installation holes.

HAND SPLIT SHAKE INSTALLATION GUIDE

INSTALLATION STEPS (CONTINUATION)

5-Install the following section by hooking it onto the starter strip and sliding it to the left overlapping the previous. Space the sections equally according to the outdoor temperature during the installation. If product is installed in an outdoor temperature below 60°F(15°C) leave a 5/8"(1.59cm) gap between sections. For installations between 60°F(15°C) and 90°F(32°C), space sections 1/2"(1.27cm). For installation over 90°F(32°C) leave a 3/8"(0.95cm) gap between sections (Figure E). Once the section has been properly spaced, fasten it as previously indicated. Repeat this step until the end of the row.

6-Begin the second row by cutting the first section with approximately 8"(20.32cm) increment from the cutting line of the first row. Hooking the section onto the top of previous row. Never force sections down on top of each other or into each other, left to right, or else risk breaking the stop posts on the back of the product. Set them into place gently, ensuring that all fingers and/or side locks are engaged, and allow the sections to seat themselves. The stop posts are designed to prevent buckling due to changing temperatures. In order to achieve a realistic Hand Split Shake look, alternate the cut position of each subsequent course in increments of 8"(20.32cm) (Figure F).

7-For the last row or places where you may need to attach product other than in installation holes, use a knife to create a new 1"(2.54cm) slot (Figure G); the slot must be wider than the fastener but not as wide as the fastener head. Although not set in installation holes, this type of cutting will allow the expansion/contraction movement of sections.

-Note: For proper installation & optimal appearance, shim as required to adjust the angle of the last row.

Reminder: Do not set accessories directly on the product. The fasteners must be fixed into a solid surface. If you need to set accessories over TandoShake, at a concealed spot on the product, create a new 1"(2.54cm) slot larger than the fastener body but smaller than the fastener head to permit expansion/contraction of sections.

SPECIAL SITUATIONS AND SUGGESTIONS

SITUATION:	ITEMS TO CHECK:
- Sections won't lock together side to side.	The wall may not be level and flat. Check previous section to ensure that all sections and installation fingers are properly seated. (See General Information) Use shims as needed to ensure a level wall surface.
- The bottom locking fingers won't lock onto the previous row.	
- Sections are buckling on the wall.	Make sure the fasteners are not restricting product movement. Check for proper spacing between adjacent sections. Make sure all fingers are properly engaged into previous section.
- Sections are not laying flat against the wall.	

HAND SPLIT SHAKE INSTALLATION GUIDE

DECORATIVE CORNERS INSTALLATION: VERTICAL & MANSARD APPLICATION

Caution: Hand Split Shake corners must be installed on wall prior to installing the Hand Split Shake sections. It is recommended that no more than two corner pieces are installed at one time so that slight adjustments on corner height can be made to match the height of section rows if necessary. The following illustrations show the corner installation on vertical application. However, the installation steps provided in this guide are for both applications, vertical and mansard (with a minimum slope of 45/12).

1-Install a first corner about a 1/4"(0.64cm) below the starter strip and fasten it at the top and the bottom on both sides of the corner (Figure H).

Figure H

2-Install another corner onto the previous one and adjust its height according to the middle butt line of the first pre-cut section (Figure I). Since it is not possible to exactly match the two shakes that will meet at the wall corner, compensate by finding an approximate location between the two. Adjustment may be made up to 1"(2.54cm) of travel. Once correctly positioned, slide section slightly to the right and fasten the corner as previously indicated.

Figure I

3-Slide back the section into the receiving channel of the corners and align the section edge with the insertion mark (Figure J).

Figure J

4-Repeat steps 2 and 3 all the way to the wall top by installing one corner at a time and adjusting its height to maintain a nice and realistic look of Hand Split Shake. Note: install and fasten two corner pieces for one row of Hand Split Shake.

5-For the last corner only, cut excess from part and fasten it on wall at the top and bottom holes on each side of the corner (Figure K).

Figure K

HAND SPLIT SHAKE INSTALLATION GUIDE

INSTALLATION TIP

1-Many solutions are possible to finish an inside corner: Inside Corner Post (A) or two J-channels (B) (Figure L). It is important to seal the inside corner of the wall prior to the installation of the trim.

Figure L

For details, see the respective installation guide of each product.

If desired, the exposed bottom of the lowest corner may be capped using a flat portion of the Hand Split Shake section. Use the template provided below to cut a small piece to fit the corner. The piece may be attached using pop rivets or small screws.
